### Abstract

On 8 November 2016, the Government of India announced the demonetisation of all 500 and 1,000 banknotes of the Mahatma Gandhi Series. This paper elucidates the impact of such a move on the availability of credit, spending and level of activity in the Real Estate sector of the country. Initially, we referred to diverse articles to understand and evaluate the short run and medium-term impacts that such a shock is expected to have on the economy. This was followed by first formulating a framework and then a hypothesis which listed the possible factors that could be most affected by the demonetization. A questionnaire was prepared and 50+ responses were recorded. A reliability test was conducted to ascertain the dependence on the data set. The responses were analyzed using factor analysis and regression. It was found that demonetization did not primarily have a significant effect on the real estate sector because existing slump in the sector spanning the last three years.

**Keywords:** Demonetization, Real Estate Sector, India

### Introduction

The real estate sector is one of the most globally recognised sectors. In India, real estate is the second largest employer after agriculture and is slated to grow at 30 per cent over the next decade. The real estate sector comprises four sub sectors - housing, retail, hospitality, and commercial. The growth of this sector is well complemented by the growth of the corporate environment and the demand for office space as well as urban and semi-urban accommodations. The construction industry ranks third among the 14 major sectors in terms of direct, indirect and induced effects in all sectors of the economy. The Indian real estate sector has been facing significant challenges in the past few years in terms of sales and overall growth. With a lot of measures, the sector was clearly pointing towards a slow and gradual, but sure recovery.

The property sector in India has been a haven for unaccounted money due to the unorganised nature of the industry and transactions in the secondary housing market and land deals having a high component of cash involved. The government's efforts to crack down on such unaccounted money led to the demonetization on November 8th, 2016. Demonetisation brought a lot of confusion and uncertainty. Considering the structure of the deals involved, with scarcity of cash, many buyers went off the market and sellers could do little but wait.

This also resulted in the reduction of prices, thereby benefitting buyers though the magnitude of reduction was not enough to pull the buyers back to the market.

Demonetisation has already resulted in a major reduction of home loan rate interest rates, and they are expected to reduce further. Developers offering good deals and discounts are maintaining their position in a market which is now ideal for serious end-users. Hence, studying the effects of demonetization in depth was imperative.

### Research Problem

To understand the effects of demonetization on the cash dependent real estate sector in India.

### Research Objectives

1. To understand the effects of cash scarcity on the property sector.
2. To comprehend expectations of customers regarding pricing of properties post demonetization.
3. To sense the overall trajectory of the sector post demonetization owing to the existing slump from the past three years.

### Review of Literature

Chatterjee Biswajit (2016), The Impact of Demonetization in India states the takeaway for the public in general from the announcement was as follows: Exchange of old currency notes for new ₹500 and ₹2,000 currency notes have been permitted until 31 December 2016 (i.e. 50 days from the date of the announcement). Such currency exchanges have been limited to certain specified amounts announced from time to time and excess amounts are required to be deposited with banks subject to applicable KYC requirements. Cash withdrawals have been limited to ensure adequate supply of new currency notes. Usage of old currency notes has been permitted for certain specified periods and purposes, such as at hospitals and pharmacies, gas stations and foreign currency exchange for tourists. With respect to the topic of our concern, real estate has always had an informal funding in the form of cash transactions for various reasons such as tax evasion, wages to contract workers, etc. Also, the luxury end buyers would prefer resorting to payment in cash, the event thus resulted in a lack of such transactions. With this move from the government is expectation is to bring out a transparency in the market and bring about equilibrium in the market volatility. The real estate sector especially in the small and middle segment has been unorganized, fortunately the investments in the following field has been conventionally through private players. With demonetization in the picture and better governance of the real estate sector we can expect a higher percentage of foreign direct investment into the market through electronic transfers.

Square Yards (2016), The Impact of Demonetization on

Indian Real Estate report that the demonetization move will lead to exponential increase in institutionalization funding i.e. banks, private equity houses. This will also result in the short to mid-term notable price correction in the secondary real estate could be seen due to higher involvement of cash.

Impact on the Primary market segment: Minimal, since this market is highly consolidated of the housing department with much of the transactions requiring the support of home loan facilities.

Impact on the Resale market segment: This market will take a hit, as the prices were inflated as they involved cash transactions to minimize capital gains and tax evasions.

Impact on the Land sales: The effects of demonetisation should be reflected immediately due to price correction as a junk of the transactions consisted of a relatively higher percentage in the cash component.

Motilal Oswal (2016), The Impact of Demonetization on Real Estate assert that the whitepaper released by the Indian Government in 2016, real estate accounted for 11% of the nation's GDP of which consisted of 50% in black money. Therefore, a price correction of 20-30% is expected in the luxury segment. Though, projects by reputed and credible builders should not face a price or dip in the demand. With new acts like RERA (Real Estate Regulation and Development Act 2016) and Benami Transactions act, the sector will soon churn to be more transparent. This move will trouble the buyers with a delay in delivery of the projects due to the cash crunch resulting in unproductive days.

NIPFP (2016), Demonetisation: Impact on the Economy believes the middlemen in resale of properties usually were paid in cash and would then lead to creation of unaccounted wealth. Such an issue seems to be tackled, though this has led to a drop in the income of this sphere of work. This has also resulted in lower earnings for the middlemen due to drop in prices. Apart from the above, a contraction is widely visible in the employment factor of the construction industry. All the skilled and unskilled labourers are day workers and are on contract basis. Thus, they are paid in cash. Most of these labourers do not have bank accounts as their daily income does not see any savings.

Knight Frank (2016), India Economic Update December observed an average of ₹2.36 lakh crore worth of investments in a quarter but due to demonetisation this quarter received only ₹1.25 lakh crore, a significant drop in the figure. In the following regard to the construction industry, the complimentary industries such as the cement and steel showcased a dip in growth rates of 6.2% and 16.9% respectively. In short with promises from the government for remonetisation we can expect an improvement in such figures and sentiments across the industry and people.

Money Control (2016), Demonetisation: Dissecting the impact on real estate sector identified that the market will experience a lull. The sudden restriction on Rs 500 and Rs 1000 money notes has brought about a circumstance of constrained or no trade out the market to be stopped in land resources. This has hence converted into a sudden fall in housing demand across all classes for the time being. While a share of this dwindled demand could be credited to diversions brought on by the move, numerous industry specialists opine this is a consequence of a trust shortage in the market. Cash has ended up dearer, prompting to careful spending and negligible exchanges.

ET Bureau (2016), Why property is likely to be cheaper after demonetisation? State that as per CARE Ratings points out in its report; developers are already grappling with the problem of slow sales, which is leading to rising inventory levels in all major micro markets. Given the growing uncertainty and negative impact on demand caused by demonetisation, people are likely to postpone their plans to buy property, which would lead to further increase in inventory levels. Because of this, developers and sellers could be compelled to cut down prices to drive sales. Most experts believe this will lead to the secondary market slowing down due to a shortfall of cash.

The Indian Express (2016), Real Estate demonetisation: Measuring the impact of Demonetisation ascertained that it brought a lot of confusion, uncertainty along with it and, most of all, rumour-mongering especially when it came to the realty sector. Everyone was affected by this radical measure, and initially, all possible economic activities slowed down. It is important to understand how important this sector is to the Indian economy. The sector contributes 5-6 per cent of the country's GDP, and any misinformation in a sector that is largely sentiment-driven can lead to chaos.

Firstpost (2016), Demonetisation: Strong foundation laid for real estate but price correction could be limited emphasise that we must understand the cash-economy of real estate transactions, and, the demand-mechanism. There is a general anticipation of the removal of 20-30 percent cash-dealings from the transaction process. It leads people to conclude that the prices would fall by 20-30 percent. The reason for such expectations is the climbing down of prices coupled with at least two other factors such as an eventual interest rate decline and the consequent rise in demand. There could be more factors. But even if we account for these, the anticipated price-decline of 20-30 percent will get cushioned. In the final form, the price-correction may not be more than 5-8 percent, which is evident already.

Mint (2016), Opinion divided over impact of demonetisation on real estate prices think that many property advisers have predicted land and property prices, particularly that of luxury houses, could fall as much as 30% in the next three to six months. However, several developers and brokers said

there is little room for any major price cuts due to rising input costs, and given that property prices in key markets have remained stagnant due to a three-year slowdown in the real estate sector. Some other developers said as banks are awash with money following demonetisation as customers deposited tonnes of cash, home loan rates may come down in the coming months, helping push property sales.

JLL (2016), Impact of Demonetization on Residential Real Estate identify that the sector has traditionally seen a very high involvement of black money and cash transactions. However, almost all such incidences have been in the secondary sales market. There has for long been a strident demand to bring transparency in the sector so that it becomes more organized, and cash dealings must necessarily be the first symptom of the disease to be dealt with. The luxury and high-end segments of residential real estate will also see a major impact from this exercise, since it is another area which has seen a lot of payments done in cash. The legal banking/financing channels have accounted for only a small part of all transactions in this space. The demonetization move is likely to result in luxury property prices dipping by as much as 25-30%

Indian CEO (2016), SWOT On Impact Of Demonetization On Real Estate Industry state that the Indian Housing sector itself contributes to 5-6% of country's GDP and this sector owing to its behaviour of huge cash dealings is bound to face major challenges in near future. The sector which has always been the prodigy of black money has suddenly closed its doors and refused to be tainted further. This will bring about a correction in property prices. The step will also eradicate land mafias and curtail price inflations.

Tax Guru (2016), Impact of Demonetization on Real Estate in India report that another factor that may add to correction in Real Estate Pricing is the increase in piling of Inventory for developers and real estate sellers and the corresponding increase in working capital pressures. With the reduction in cash component, there is bound to be a sluggish demand in real estate for short term at least which will increase the inventory with the developers. Another very important cycle that the demonetization will initiate is cheaper lending of borrowed funds by Routine Banking Network. Due to increase in funds flow with the bank the Marginal Cost of Lending Rate (MCLR) is bound to reduce which will help the house buyers to buy at affordable EMI's. The commercial real estate will see the minimum impact on office/industrial leasing and transactions business; given that cash components do not play a significant role in such transactions and ever increasing demand for this asset.

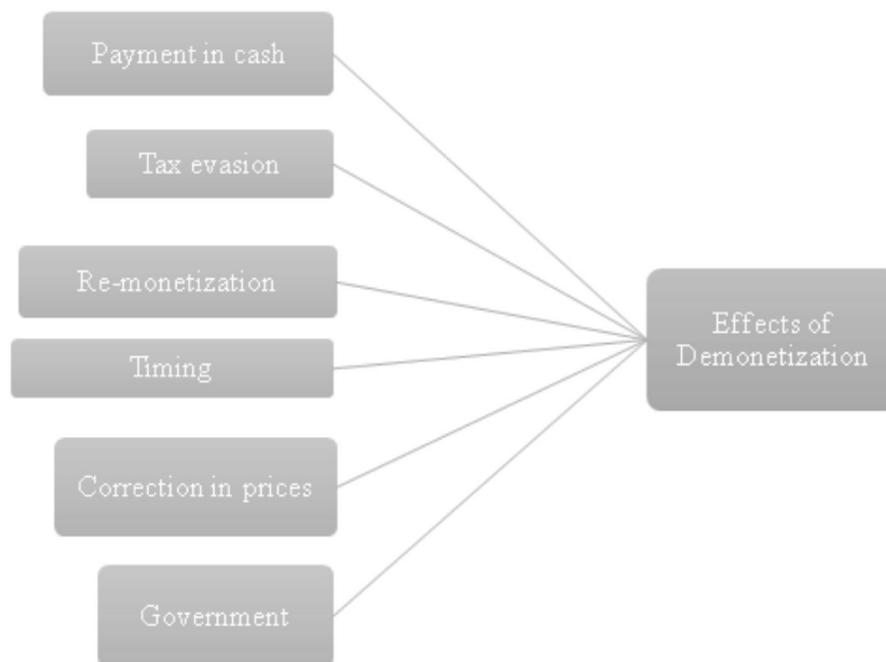

International Journals (2016), Impact of Demonetisation on Construction Industry report that the first and foremost is fleeing of labour force from the sites. They were not paid money for the days they worked. They could not prolong in a new place without liquid cash. The local people were also

reluctant to extend credit facility to migrant workers, as they themselves were badly hit by poor cash sales. Consequently, the labourers were returning to their villages. Many of the ongoing projects came to a standstill. Majority of workers do not have bank account at all. As they are the floating population seeking job, it is literally impossible for them to open bank accounts from place to place. The Contractors, though they had sufficient balance, could not draw from bank in view of the restrictions on the amount and number of transactions per week. They were only silent spectators to the fleeing of workers from the site. The new bookings were virtually nil. The Builders who made a massive investment are in troubled waters. India's decade long construction boom created one in three new jobs as tens of millions of people made journey from rural areas to towns seeking livelihood, came to a grinding halt. This sparked a blow also on the Cement and Steel makers who faced a sudden slump in demand.

India Infoline (2016), Dissecting the impact on the real estate sector believe that the demonetisation could also mean fresh sources of funding for developers to complete their projects. Some of the alternate sources may include the following: Developers will be forced to clean up their balance sheets so that they can avail funding from legitimate sources, however, this may come at extremely high costs from the Non-banking financial companies (NBFC) segment. Developers can avail short-term loans from their existing buyers at market price with a promise to deliver the project on time and at an interest rate as per the agreement in the sales deed. Investments from private equity firms would usher positive sentiment across the market, helping developers to source funding and strengthen end-user demand.

### Research Methodology

#### THEORETICAL FRAMEWORK

#### Hypotheses

##### Payment in Cash

$H_0$ : The payment in cash for sale and lease agreements in the real estate has led to a fall in quantity of transactions.

$H_a$ : There has not been a fall in quantity of transactions due to payment in cash.

##### Tax evasion

$H_0$ : Due to unavailability of cash in the market, there has been no drop in misleading transactions to reduce the net tax to be paid.

$H_a$ : Due to unavailability of cash in the market, there has been drop in misleading transactions to reduce the net tax to be paid.

##### Re-monetization

$H_0$ : With major cities witnessing a rapid re-monetization process, there will no effect in the number of transactions in real estate.

$H_a$ : With major cities witnessing a rapid re-monetization process, will there be a boost in the number of transactions in real estate.

**Timing**

H<sub>0</sub>: Given the already downfall in the real estate, the timing of demonetization will not have any effect as the market is already down.

H<sub>a</sub>: Given the already downfall in the real estate, the timing of demonetization will lead to a further depression which will take a long time to recover.

**Correction in prices**

H<sub>0</sub>: Despite the sales figures the sector had inflationary ask price, now due to demonetization there will be lesser transactions thus inflating the prices.

H<sub>a</sub>: Despite the sales figures the sector had inflationary ask price, now due to demonetization there will be lesser transactions thus a correction (fall) in the prices.

**Government**

H<sub>0</sub>: The policies by the government like 100% FDI in real estate and upcoming RERA act will suppress the demonetization impact.

H<sub>a</sub>: The policies by the government like 100% FDI in real estate and upcoming RERA act. These counter measures will have no impact on the current scenario.

**Data Collection Methods**

To understand effects of demonetization we will be forming

a questionnaire and circulating it to relevant respondents. All the major variables for the study were identified using data from secondary sources.

**Sampling**

The universe for this research is all people across India.

The population consists of all such people across Mumbai.

Minimum sample size will be 50

Sampling method used is non-probability convenience sampling.

**Data Analysis Method**

Factor analysis and Regression methods have been used to analyze the data collected by the method mentioned above.

6 factors identified areas follows:

1. Payment in Cash
2. Tax evasion
3. Re-monetization
4. Timing
5. Correction in prices
6. Government

**Reliability Test**

Reliability Statistics

Cronbach's Alpha	Number of Items
.880	6

Cronbach's alpha	Internal consistency
$\alpha \geq 0.9$	Excellent
$0.9 > \alpha \geq 0.8$	Good
$0.8 > \alpha \geq 0.7$	Acceptable
$0.7 > \alpha \geq 0.6$	Questionable
$0.6 > \alpha \geq 0.5$	Poor
$0.5 > \alpha$	Unacceptable

As per the above ranges our questionnaire's consistency falls in the "Good" category and can be considered as a reliable data source.

Preliminary analysis was done to understand the factors leading up to the variability. Therefore a factor analysis was done on the basis on Eigen values expected to be 1.

**Factor Analysis**

**The results of the analysis are as follows:**

Communalities

	Initial
Cash_Payment	1.000
Effective_Taxes	1.000
Reversal	1.000
Timing	1.000
Correction	1.000
Government	1.000

Extraction Method: Principal Component Analysis.

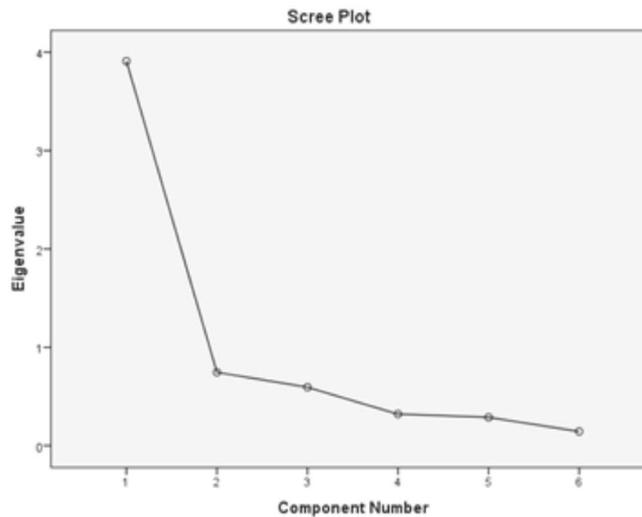

**Total Variance Explained**

Component	Initial Eigenvalues		
	Total	% of Variance	Cumulative %
1	3.910	65.164	65.164
2	.745	12.415	77.579
3	.593	9.889	87.468
4	.320	5.337	92.805
5	.288	4.797	97.602
6	.144	2.398	100.000

Extraction Method: Principal Component Analysis.

Therefore, as eminently visible component 1 “Cash Payment” describes the highest variation.

Looking at the Scree plot, we can see that it might lead you to a slightly different conclusion—it looks like the slope of this curve levels out after just two factors, rather than three.

Component	Initial Eigenvalues			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	3.910	65.164	65.164	3.388	56.465	56.465
2	.745	12.415	77.579	1.267	21.114	77.579
3	.593	9.889	87.468			
4	.320	5.337	92.805			
5	.288	4.797	97.602			
6	.144	2.398	100.000			

Extraction Method: Principal Component Analysis.

**Rotated Component Matrix<sup>a</sup>**

	Component	
	1	2
Cash Payment	.780	.223
Effective Taxes	.913	.174
Reversal	.786	.414
Timing	.851	.131
Correction	.223	.966
Government	.744	.253

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

Finally, the Rotated Component Matrix showed the factor loadings for each variable.

The first 5 subtests loaded strongly on Factor 1, which was “Performance of Real Estate” --Picture Completion through Object Assembly all loaded strongly on Factor 2, which was “Impact of Demonetization”

**Component Transformation Matrix**

Component	1	2
1	.914	.406
2	-.406	.914

Extraction Method: Principal Component Analysis.  
 Rotation Method: Varimax with Kaiser Normalization.

From the above analysis, we can safely conclude that the performance of Real Estate was not primarily affected by demonetization.

**Regression Descriptive Statistics**

	Mean	Std. Deviation	N
Cash_Payment	3.94	.890	50
Effective_Taxes	3.94	.682	50
Reversal	3.88	1.081	50
Timing	3.96	.968	50
Correction	3.46	.994	50
Government	4.16	.738	50

**Correlations**

		Cash_Payment	Effective_Taxes	Reversal	Timing	Correction	Government
Pearson Correlation	Cash_Payment	1.000	.666	.650	.684	.401	.450
	Effective_Taxes	.666	1.000	.792	.707	.372	.748
	Reversal	.650	.792	1.000	.658	.527	.612
	Timing	.684	.707	.658	1.000	.359	.552
	Correction	.401	.372	.527	.359	1.000	.398
	Government	.450	.748	.612	.552	.398	1.000
	Sig. (1-tailed)	Cash_Payment		.000	.000	.000	.002
Effective_Taxes		.000		.000	.000	.004	.000
Reversal		.000	.000		.000	.000	.000
Timing		.000	.000	.000		.005	.000
Correction		.002	.004	.000	.005		.002
Government		.001	.000	.000	.000	.002	
N		Cash_Payment	50	50	50	50	50
	Effective_Taxes	50	50	50	50	50	50
	Reversal	50	50	50	50	50	50
	Timing	50	50	50	50	50	50
	Correction	50	50	50	50	50	50
	Government	50	50	50	50	50	50

**Variables Entered/Removed<sup>a</sup>**

Model	Variables Entered	Variables Removed	Method
1	Government, Correction, Timing, Reversal, Effective_Taxes <sup>b</sup>		Enter

a. Dependent Variable: Cash\_Payment

b. All requested variables entered.

**Model Summary**

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.755 <sup>a</sup>	.570	.522	.616

a. Predictors: (Constant), Government, Correction, Timing, Reversal, Effective\_Taxes

b. Dependent Variable: Cash\_Payment

The R value represents the simple correlation and is 0.616 (the "R" Column), which indicates a high degree of correlation. The R2 value (the "R Square" column) indicates

how much of the total variation in the dependent variable, can be explained by the independent variable. In this case, 57% can be explained, which is in the median.

**ANOVA<sup>a</sup>**

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	22.141	5	4.428	11.682	.000 <sup>b</sup>
	Residual	16.679	44	.379		
	Total	38.820	49			

a. Dependent Variable: Cash\_Payment

b. Predictors: (Constant), Government, Correction, Timing, Reversal, Effective\_Taxes

This table indicates that the regression model predicts the dependent variable significantly well. Look at the "Regression" row and go to the "Sig." column. This indicates the statistical significance of the regression model

that was run. Here,  $p < 0.0005$ , which is less than 0.05, and indicates that, overall, the regression model statistically significantly predicts the outcome variable (i.e., it is a good fit for the data).

**Coefficients<sup>a</sup>**

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.722	.590		1.224	.227
	Effective_Taxes	.457	.272	.350	1.681	.100
	Reversal	.136	.149	.166	.917	.364
	Timing	.349	.132	.380	2.640	.011
	Correction	.102	.107	.114	.958	.343
	Government	-.203	.183	-.169	-1.110	.273

a. Dependent Variable: Cash\_Payment

This table also includes the Beta weights (which express the relative importance of independent variables) and the

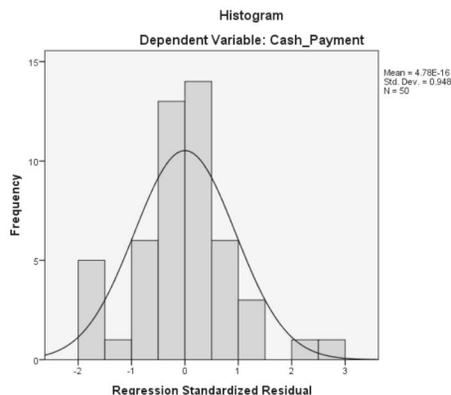

collinearity statistics.

**Residuals Statistics<sup>a</sup>**

	Minimum	Maximum	Mean	Std. Deviation	N
Predicted Value	2.01	4.93	3.94	.672	50
Residual	-1.222	1.755	.000	.583	50
Std. Predicted Value	-2.869	1.467	.000	1.000	50
Std. Residual	-1.985	2.850	.000	.948	50

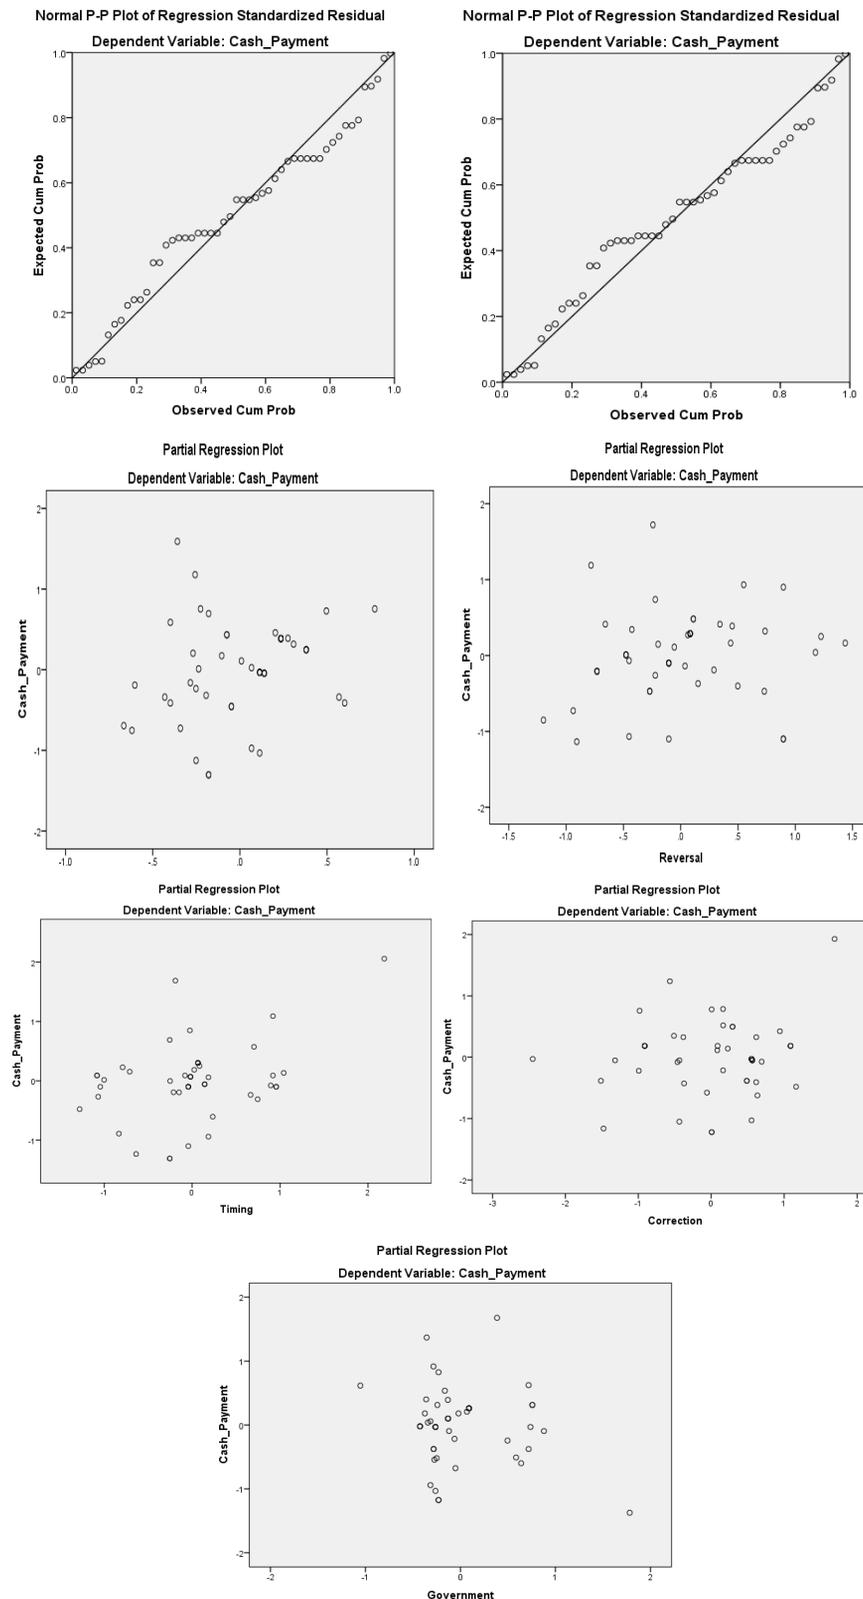

a. Dependent Variable: Cash\_Payment

**Charts**

The last thing to check is the homoscedasticity and normality of residuals. The histogram indicates that the residuals approximate a normal distribution. The Q-Q-Plot

of shows that in linear regression analysis there is no tendency in the error terms.

## Summary & Conclusion

### Restatement of Problem

Impact of demonetization of the Real Estate sector.

### Major Findings:

Through this analysis, it has been found that the three major and most important factors:

1. Payment in Cash
2. Tax evasion
3. Re-monetization
4. Timing
5. Correction in prices
6. Government policies (RERA Act, 100% FDI in Real Estate)

### Conclusions & Implications

After analysing the various factors and performing a factor analysis it can be noticed that the effect of variables the real estate sector was already in a bad shape and further demonetisation pushed the sector to its limits and thus the recovery of the sector has been delayed further by another 18 months.

### Implications:

Thus, we can say that the main factors for the impact on real estate are:

1. Temporary correction in inflationary pricing
2. No immediate support from the government for sustainability of the sector
3. Ill timing, given the situation of the sector.

### Limitations of The Study:

1. Only one metropolitan city i.e. Mumbai has been considered in this research.
2. The sample size is very small in comparison to the population to generalize the findings for the universe.
3. Rural and semi-urban areas have not been considered.

4. A multi-factor equation could not be created given the available macro variables.
5. Commercial sector could not be analysed in depth.
